How mega-floods can be predicted

When floods are predicted only on the basis of local data, there may be unpleasant surprises. A new method makes it possible to significantly improve predictions - using international data from hydrologically similar areas. The new approach has been developed within a major international research project led by Vienna University of Technology.
Research results have been published in November 2023.

EWA NEWS presents you an overview of the results as well as links to authors and the full text of the publication in Nature Geoscience <u>16</u>, pp 982-988 (2023)
