Anaerobic Treatment of Domestic Wastewater: Present Status and Potentialities

The main challenge in wastewater treatment is changing the perception of wastewater as a waste product to be treated or disposed of, and instead seeing it as a source of energy and other valuable by-products.

Anaerobic Treatment of Domestic Wastewater: Present Status and Potentialities presents the current state of knowledge and future perspectives of the anaerobic process applied as a mainstream treatment method of domestic wastewater. 12 chapters, over a total of 353 pages, cover engineering, microbiology, process monitoring and control, sustainability, life-cycle assessment, and techno-economic analysis.
